---

## PROFESSIONAL SUMMARY

---

Full-stack Developer with an emphasis on front-end and cloud infrastructure, and a Computer Engineering student at UFSCar. On the front-end, I work with React, TypeScript, and Next.js to build complex, responsive interfaces. On the back-end and infrastructure side, I have hands-on experience with cloud data pipelines (GCP, Cloud Run), integration automation, security, and access control (Keycloak, RBAC). I'm looking for roles where I can apply a systemic view — from data modeling to the user interface — to contribute to product teams.

---

## PROFESSIONAL EXPERIENCE

---

### Front-end Developer · BipGroup (UFSCar)

03/2024 – 09/2025 | FAPESP Scholar — Technical Training in Web Development

- Designed and implemented 30+ screens in Figma and React + TypeScript for the platform, covering two distinct access profiles (standard user and administrator), plus the Landing Page and authentication/sign-up pages
- Developed reusable React + TypeScript components for rendering DICOM and NIFTI files directly in the browser
- Integrated the interface with the backend API to send and receive data, including DICOM and NIFTI images
- Implemented sign-up, login, and user session systems
- Iterated the design of critical flows in V1 and V2 before implementation, catching UX issues during prototyping and avoiding rework in code

### Internship — Data Engineer · Deep Metrics

09/2025 – Present

- Built 10 production ETL pipelines with n8n and Cloud Run, extracting data from Meta Ads, Google Ads, Microsoft Ads, GA4, Bitrix24, HubSpot, Pipedrive, and RD Station for centralization in BigQuery
  - Set up advanced tracking with GTM, sending conversion data in parallel to GA4, Meta Ads, Google Ads, and Microsoft Ads, enabling cross-channel attribution and improving signal quality for campaign optimization algorithms
  - Modeled data in BigQuery and developed the main Looker Studio dashboard, consolidating metrics from multiple acquisition channels into a single view for clients
  - Started development of an internal platform in React + TypeScript with Supabase and BigQuery on the backend to replace static dashboards with a dynamic data interface
- 

## ADDITIONAL INFORMATION

---

**Undergraduate Thesis — "Study of Code Generation via JS-Distributor for an Authentication and Authorization System"** (completed · advisor: Prof. Daniel Lucredio, UFSCar) Automatic generation of authentication and authorization mechanisms (Keycloak, RBAC) integrated into a code generator for monolith → microservices migration. Involved architectural modeling of access control and propagation of security context in distributed systems.

### Teaching Assistant — Introduction to Algorithmic Thinking (UFSCar)

SKILLS

| Category            | Technologies                                                         |
|---------------------|----------------------------------------------------------------------|
| Front-end           | React, Next.js, TypeScript, JavaScript, CSS (responsive), Figma      |
| Back-end & Security | Python, Microservices, Authentication/Authorization (Keycloak, RBAC) |
| Cloud & Infra       | GCP (Cloud Run, BigQuery), Docker, Docker Compose, n8n               |
| Testing             | Jest                                                                 |
| Database            | SQL                                                                  |
| Languages (spoken)  | English (intermediate), Portuguese (native)                          |

**Positioning note:** the back-end experience is oriented toward cloud infrastructure, data pipelines, and security — not traditional REST API development. The profile fits teams that value developers with a systemic view and the ability to work across multiple layers.
